SUMMARY

Senior Backend Engineer with 8+ years building and owning distributed systems across fintech, logistics, and high-scale commerce. Deep experience with external provider integrations, asynchronous and event-driven workflows, and production reliability at scale. Strong in Go, TypeScript, Node.js, and AWS, with a track record of technical leadership through RFCs, incident ownership, and mentoring.

SKILLS

- **Languages:** TypeScript · Go · Java · Python · SQL
- **Backend:** Distributed systems · REST APIs · Event-driven / Kafka · DynamoDB · Redis · Node.js · Cognito
- **Frontend:** React
- **Async & Integration**: SQS · Lambda · Webhooks · External Provider APIs · Idempotent & Fault-Tolerant Processing · Ordered Event Processing
- **Cloud & Infra:** AWS (Lambda, SQS/SNS, Aurora, ASG, ECS/EKS, APIG) · Terraform · CI/CD · Serverless
- **Practices:** System Design (HLD/LLD) · Observability · On-call ownership · Code review
- **AI Tooling:** Cursor · Claude Code · Agentic workflow automation

WORK EXPERIENCE

Reap Technologies (*Fintech — Card/Payments***)** **May 2025 – ongoing**
Sr SDE (Full Stack) Hong Kong *(Remote)*

- **Provider Architecture:** Designed & built a provider-agnostic integration layer (feature flags, modular screening) over direct integration, so future provider swaps don't need upstream rewrites.
- **Platform Architecture & Organizational Leadership:** Designed and drove production adoption of a Universal KYC Ingestion Framework, standardizing API contracts and integration workflows across 10+ clients and aligning internal teams around a provider-agnostic architecture. Enabled 3 client launches in week one and contributed to 15% more card creations.
- **Fault Tolerance**: Fixed silent failure paths in webhook and notification processing: added state guards, concurrency protection, and per-entity ordering for duplicate/out-of-order Sumsub webhooks, and transient-vs-persistent error classification so failed notifications retry instead of dropping.
- **Agentic Tooling:** Built an agentic alert debugger: a Slack reaction triggers a root-cause investigation (small model first, escalating to a larger one) that posts a structured verdict and proposed fix; per-service context docs let it separate real 5xx from noise. Saved **~38+ eng-hrs/month**.
- **Reliability**: Traced a hot ~153K calls/day KYC endpoint's p99 tail to JSON_EXTRACT full-table scans on a minority path and added a DynamoDB cache for that path only (**p99 -22%, RDS CPU -21%**); fixed a recurring alert that counted 4xx as 5xx, removing 106 false fires in 30 days.
- **Technical Leadership**: Led cross-team delivery with BinSp and LatAm, Authored 5+ architecture RFCs in H1 2026, reviewed 100+ cross-team PRs, and mentored engineers across KYC, routing, and infrastructure while shipping hands-on production code.

Flexport (Logistics) **Sept 2024 – Oct 2024**
Sr SDE Bangalore, IN

- **Ownership**: Owned Channels & Parcel modules across 12 carrier integrations, covering product, inventory, and order management for Flexport's in-house logistics platform.
- **Architecture**: Designed RBAC auth system on AWS Cognito for parent company integration

- **Standards**: Improved documentation, PR hygiene, and code review standards across the team.

Swiggy (Quick Commerce**)** **Nov 2021 – Aug-2024**
Sr SDE Bangalore, IN

- **Leadership**: Led 3 pods (GrowthX, Partnership, Martech) — owned technical direction, architecture, and end-to-end delivery across all three; partnered with product and program on scoping and resource planning across 10+ projects.
- **Greenfield**: Designed and built Martech from zero — no existing vendor tooling met Swiggy's multi-category ads model, event and inventory management across vendors; drove 30,000 new orders/day
- **Delivery**: Led gamification across 4 teams, 10 engineers, 3-week deadline with requirements evolving mid-sprint — zero bugs, 17,000 incremental orders/day
- **Scale**: Built P2P reward and communications platform on Go + AWS handling 100K+ API req/min with full observability
- **Simplification**: Simplified 25 microservices across a half-yearly plan — $1,500+/month in infrastructure savings; grew engineers through design reviews and direct pairing on hard delivery

Oracle **May 2019 – Nov 2021**
SDE 2 Hyderabad, IN

- **Re-engineering:** Rearchitected the Individual Compensation module end-to-end — fixed 40+ bugs, optimised calculation components for 35% faster execution, removed redundant code, and improved workflow efficiency
- **Ownership**: Sole owner of the module — delivered all product enhancements, new feature additions, and user management changes with fully independent end-to-end ownership
- **Quality:** Introduced integration testing and established code quality baseline for the module; improved maintainability for future feature development

LTI **June 2016 – May 2018**
SDE 1 Pune, IN

- **Platform**: Built a recursive rule engine using ANTLR4 generating 1,300+ evaluation rules for survey-response processing.
- **Impact**: Built full-stack financial applications enabling early defaulter detection in Wholesale Banking — $350K in revenue, Best Performer of the Quarter in our business unit.

EDUCATION

College of Engineering, Pune **May 2016**
B. Tech., Information Technology Pune, IN
